Flood Response Field Report (fictional sample)

On 14 March 2026, the Nordic Flood Coordination Centre in Helsinki asked Kestrel Orbital to task its radar satellites over the Kokemaki river basin in western Finland. Kestrel Orbital delivered the first SAR images to the centre within six hours.

Dr. Aino Virtanen, who leads the Helsinki team, compared the radar images with optical data from Sentinel-2. Cloud cover over Pori made the optical images unusable, so the team relied on Kestrel Orbital radar data for the first three days.

By 17 March 2026, Aino Virtanen reported that the flooded area near Pori had grown to 42 square kilometres. The Finnish Red Cross used the maps to plan evacuations in Pori and Ulvila. Marcus Lindqvist of the Finnish Red Cross said the maps arrived faster than in any previous flood.

Kestrel Orbital will present the response at the Living Planet Symposium in Vienna in June 2026. The Nordic Flood Coordination Centre plans to extend its contract with Kestrel Orbital through 2027.
